Delaware Health Gaps Report

What’s driving health differences across the state and how can those gaps be closed?
Every year, **one in six deaths under age 75 in Delaware — over 550 deaths — could be avoided** if all residents in the state had a fair chance to be healthy.

If residents of all three counties in Delaware had the same opportunities for health, there could be:

- **12,000** fewer adult smokers
- **16,000** fewer adults who are obese
- **26,000** fewer adults who drink excessively
- **4,000** fewer people who are uninsured
- **8,900** more adults, ages 25-44, with some education beyond high school
- **4,400** fewer children in poverty
- **824** fewer violent crimes
Introduction

Why is there so much difference in the health of residents in one county compared to other counties in the same state? In this report, the *County Health Rankings & Roadmaps* program explores how wide gaps are throughout Delaware and what is driving those differences.

This information can help Delaware state leaders as they identify ways for everyone to have a fair chance to lead the healthiest life possible. Specifically, this document can help state leaders understand:

1. What health gaps are and why they matter
2. The size and nature of the health gaps among counties within Delaware
3. What factors are influencing the health of residents, and
4. What state and local communities can do to address health gaps.

**What are health gaps and why do they matter?**

As a country, we have achieved significant health improvements over the past century. We have benefited from progress in automobile safety, better workplace standards, good schools and medical clinics, and reductions in smoking or infectious diseases. But when you look closer, within each state across the country—including Delaware—there are significant differences in health outcomes according to where people live, learn, work, and play. It is clear that not all Americans have the means and opportunity to be their healthiest.

---

**Gaps in length and quality of life.** Residents in one county are more likely to die prematurely or not be as healthy as residents in another county in the same state if they do not have the same kinds of opportunities to be their healthiest.

**Gaps in the factors that influence health.** Health is influenced by every aspect of how and where we live. Access to affordable housing, safe neighborhoods, job training programs and quality early childhood education are examples of important changes that can put people on a path to a healthier life even more than access to medical care. But access to these opportunities varies county to county. This limits choices and makes it hard to be healthy.

Poor health disproportionately burdens people who live in places that limit opportunities to live long and well. These gaps in health outcomes are costly and preventable. Gaps in health could be narrowed, if not eliminated, if we took steps to create more equitable opportunities. Improving education in counties that need it most is one example. That step and others can lead to higher incomes and more lifetime stability.
Giving everyone a fair chance to be healthy does not necessarily mean offering everyone the same resources to be healthy, but rather offering people specific resources necessary for their good health. For example, consider three children of different heights. Offering them all the same size bench to stand on would mean that shorter children do not have a fair chance to see over the wall. Offering each child a bench to stand on that is the right size for their height gives all children a fair chance to see over the wall.

Health gaps can exist in many dimensions—for residents across neighboring county lines, or between various groups within a community according to race, ethnicity, age, income, education or sexual orientation, among others. For this report, we focus on the gaps in opportunities for health that exist between counties within Delaware, and provide strategies to address factors that influence these differences.
How big are the gaps in health outcomes between counties within Delaware?

Every year, one in six deaths under age 75 in Delaware — over 550 deaths — could be avoided if all residents in the state had a fair chance to be healthy.

Most of Delaware’s 550 excess deaths occur in New Castle County, which has a higher population. However, Kent County, with a smaller population, also has a disproportionate share of avoidable lives lost. For example, over 22 percent of premature deaths in Kent County could be avoided if Kent residents had the opportunities of those in healthier counties in their region.

Of course, population size is not the only factor that state leaders should take into account when selecting strategies to solve health gaps. We know that there are many factors that shape health. The next page of this report highlights factors state leaders may want to pay particular attention to as they work to improve health for all.
Highlighted health gaps in Delaware

Highlighted measures (➔) indicate meaningful gaps that policymakers and leaders may want to examine more closely. We define meaningful gaps as those that are noteworthy or statistically different from a state or U.S. value for factors that have the greatest influence on health (e.g., social and economic factors have a greater influence than clinical care). The best and worst counties represent the top and bottom 10% of county-level values for a given measure in the state or the U.S., respectively.

What can be done to help close gaps in Delaware?

Here are some examples of evidence-informed strategies to improve the above highlighted health factors:

**Tobacco Use (Adult smoking)**
- **Proactive tobacco quitlines** Deliver phone-based behavioral counseling and follow-up for tobacco users who want to quit
- **Tobacco marketing** Limit the pricing, flavoring, placement, or promotion of tobacco products via regulation
- **Tobacco pricing** Increase tobacco per unit prices through taxes or point-of-sale fees

**Alcohol and Drug Use (Excessive drinking)**
- **Alcohol excise tax** Regularly adjust taxes levied for beer, wine, and liquor purchases
- **Alcohol outlet density** Reduce density of alcohol beverage outlets (i.e., places that sell alcohol) or limit increases in the density of such outlets via regulatory authority
- **Alcohol screening and brief intervention** Identify persons with harmful alcohol consumption before consequences become pronounced and motivate them to address their alcohol problems

**Education (High school graduation, Some college)**
- **Community schools** Combine academics, physical health, mental health, and social service resources for students and families through partnerships with community organizations
- **Dropout prevention programs** Provide services such as remedial education, vocational training, case management, health care, and transportation assistance, to help students complete high school
- **Targeted truancy interventions** Support interventions that provide at-risk students and families with resources to improve self-esteem, social skills, discipline, and unmet needs in order to increase school attendance

**Universal pre-kindergarten (pre-K)** Provide pre-K education to all 4-year-olds, regardless of family income
- **Targeted programs to increase college enrollment** Help students prepare academically for college, complete applications, and enroll, especially first generation applicants and students from low income families

**Employment (Unemployment)**
- **Unemployment insurance** Extend or raise the compensation provided to eligible, unemployed workers looking for jobs
- **Vocational training for adults** Support acquisition of job-specific skills through education, certification programs, or on-the-job training

**Community Safety (Violent crime)**
- **Focused deterrence strategies** Coordinate law enforcement and community agencies’ implementation of focused deterrence strategies (pulling levers) to target particular crimes
- **Neighborhood watch** Support the efforts of neighborhood residents to work together in addressing local crime and reporting suspicious or potentially criminal behavior
- **Restorative justice** Develop interventions for victims and offenders focused on repairing the harm a crime caused and collectively determining offender reparations
Choosing strategies that work

Taking time to choose policies and programs that have been shown to work in real life and that are a good fit for your state will maximize the chances of success. Focusing on policy, systems, and environmental changes – or implementing programs in a broad, systematic way – can lead to the most substantial improvements over time.

The strategies listed above are among many resources in What Works for Health, a searchable database of policies or programs that have worked in other places or are recommended by unbiased experts.

Visit What Works for Health at countyhealthrankings.org/what-works-for-health for information on these and other strategies to improve health in Delaware.
How have states and local communities taken action?

The approach to reducing health gaps is not ‘one size fits all.’ Each state and community has different assets and opportunities they can use.

Many communities across the U.S. are already addressing health gaps and building a Culture of Health. States and local communities have improved health by taking action and making changes. Just look at community revitalization efforts, the expansion of education programs that empower young people, and local and state economic development.

Robert Wood Johnson Foundation Culture of Health Prize

State and local efforts can harness the collective power of leaders, partners, and community members to provide everyone with opportunities for better health. The 2015 RWJF Culture of Health Prize winners are prime examples of making this a reality. Here are links to examples of how these communities are cultivating a shared belief in good health for all:

- Bridgeport, Connecticut
- Bronx, New York
- Everett, Massachusetts
- Kansas City, Missouri
- Lawrence, Massachusetts
- Menominee Nation, Wisconsin
- Spartanburg County, South Carolina
- Waaswaaganing Anishinaabeg (Lac du Flambeau Tribe), Wisconsin

For more detailed tools and guidance on how to improve health for all, visit the Roadmaps to Health Action Center:

www.countyhealthrankings.org/roadmaps/action-center
The County Health Rankings & Roadmaps program brings actionable data and strategies to communities to make it easier for people to be healthy in their neighborhoods, schools, and workplaces. Ranking the health of nearly every county in the nation, the County Health Rankings illustrate what we know when it comes to what is keeping people healthy or making them sick. The Roadmaps show what we can do to create healthier places to live, learn, work, and play. The Robert Wood Johnson Foundation (RWJF) collaborates with the University of Wisconsin Population Health Institute (UWPHI) to bring this program to cities, counties, and states across the nation.

Visit the County Health Rankings & Roadmaps website at www.countyhealthrankings.org to learn more about the Rankings, the health gaps for each state, and how you can take action in your community.

**How did we measure excess deaths?**
Excess deaths were estimated using two measures: population size and the difference in premature mortality risk between the county’s age-adjusted mortality rate and the rate for the top performing 10% of counties within each state or region (for states with fewer, less populated counties). Premature deaths were considered those that occurred before the age of 75. Mortality rates were calculated using [CDC WONDER data](https://wonder.cdc.gov) for 2011-2013. For each county, we examined the difference in mortality rates and then applied this risk difference to the county’s population to estimate the number of excess deaths. To estimate the total for each state, the number of excess deaths was tallied for each county within the state.

This approach considers both the magnitude of the gap in mortality rates and the population living with that rate. So, if two communities had the same mortality risk gap, more excess deaths would be observed in the community with the larger population. Similarly, if two communities had the same population size, more excess deaths would be observed in the community with the greatest gap in mortality risk.

**How did we identify health factors to improve?**
County Health Rankings data can help to identify factors with meaningful differences across counties. Accounting for the relative influence of various factors on health outcomes, a range of techniques were used to identify those factors that seem to have the greatest potential opportunity for improvement. We identified measures where there are meaningful differences between the state’s or poor performing counties’ value and that of a U.S. or state reference value for the factor. Meaningful differences indicate that for a given state, the magnitude of the difference is consequential and/or statistically significant compared to this reference value.
